*Cyclic subgroup separability of generalized free products.* (English)

Can. Math. Bull. 36, No.3, 296-302 (1993).

A criterion is proposed for a generalized free product of groups to be cyclic subgroup separable. Most of the known results for cyclic subgroup separability are covered by this criterion. It is also shown that a polygonal product of finitely generated abelian groups, amalgamating cyclic subgroups, is cyclic separable.
